Lab 6 Report

Graphs, Data, and everything that I need for Part 1:
Lab 6 log-log Plots

Sequential Search vs Self-Organizing Search:

For both The Bible and the About Time script, sequential search took significantly longer than the self-organizing search and made a lot more key comparisons. This is because successful searches don't reorder the nodes, so it takes longer to find that node again if it is being searched for. Common words instead of constantly being moved to the front will stay where they started. It also makes the put method that immediately follows the get method take a lot longer since it's not just at the front. The worst-case is still the same, however, the average time goes way down.
